

New in vitro diagnostic method for patient selection

Enter the clinical market

iVV assay™

An advanced diagnostic tool for
new medications
Malignant hematological diseases or
advanced cancer

Find the right patient for your drug!

Find your niche area

Oncology

Introducing a new medicine in oncology can be very challenging. Treatment protocols are very rigid and the drugs which are included are based on long term use and effect. Finding the patient for a recently launched drug is therefore very difficult.

Introducing the iVV assay™ in vitro laboratory diagnostic platform and selecting the right patients where the new drug has proven positive result, would save invested capital and speed up the acceptance of the launched drug by the oncologists.

Patients, health insurance companies or governmental bodies will only benefit from the new preselected treatment option, which will give the expected success rate, prolong life, make healthcare more cost efficient. The use of iVV assay™ will prevent unjustified therapies.
